We make water behave.

Wetcleaning by Wascomat

The Wascomat difference.

Wetcleaning is incredibly effective for professionally cleaning all kinds of fabrics and textiles. With Wascomat eco-friendly solutions, you will be less dependent on the need for harsh chemicals, while delivering the highest quality results to your customers.

A smart addition to traditional drycleaning

Wetcleaning can complement your existing drycleaning operation or work parallel with equipment you already have. This assures you:

- A superior method for removing stains
- Better results on PVC-lined garments and finer fabrics with sequins
- The ability to handle waterproofing and clean most garments in-house, including leather and suede

Wascomat's wetcleaning washer combines the gentle process of hand-washing with the efficiency of professional cleaning. With a Wascomat Wetclean System you'll be able to clean garments that until now were considered dryclean only.

Environmentally safe.

Wascomat's Wetclean Systems comply with OSHA, EPA and other environmental regulations while producing outstanding results. Gone are the solvents, toxic fumes and waste treatment problems associated with the dry cleaning process. Expensive ventilation systems are no longer needed.

Customers prefer wetcleaning.

Your customers will immediately see, feel and smell the difference in their clothing: **colors are brighter, fabrics softer, and the smell is fresh and clean. There is no chemical smell or residue.**

95% of all stains are water-based and respond better to wetcleaning. You can even wetclean leather and garments with beads and sequins!

The secret to wetcleaning

The first key component is water. It gives wetcleaning the capability to keep fabrics looking better and smelling fresher.

The second very important key is the use of specific detergents. When adapted to natural fibers they will protect them from deformation.

Then it is a matter of adding the correct amount of detergent, along with a gentle mechanical action over the optimal period of time. As a result, water is able to naturally remove stains and transport dirt to the waste pipe.

What's left behind is the fresh smell of cleanliness, a soft touch to the fabric, brilliant whites and bright colors. With this in mind, it's easy to see why the demand for wetcleaning is growing.

Best of both worlds.

Wascomat dual-use Wetclean Systems are an environmentally safe, non-polluting complement to dry cleaning. With the push of a button, the Wascomat Wetclean Washer converts to an ideal washer for laundering shirts, comforters, drapes and "wash-dry-fold" laundry.

No further need to rely on outsourcing for big duvets and curtains. You can easily customize your machine with a full range of laundry programs.

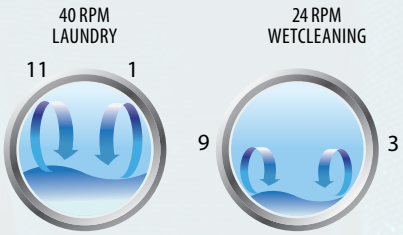
Wascomat's "Dual-use" Wetclean washers are equipped with Clarus® Control for superior cleaning results and flexibility. Clarus manages wetcleaning and laundry washing operations by precisely controlling all important functions.

Precise control of the cleaning process.

Wascomat Wetcleaning Systems eliminate the need to pre-spot since the majority of stains are water-based. Even dry-side stains can be removed by batching with the aid of modern water-based biodegradable paint, oil and grease removers. Setting stains with heat is not a concern because you can examine and treat problem garments before transferring to the dryer.

Control exact cylinder rotation in washing, rinsing and extracting.

Clarus Control lets you program the washer for the exact desired rotation speed to safely wetclean and launder a broad range of garments and fabrics.



Clothes drop from "11" and "1" positions for greater mechanical action to maximize soil removal.

Garments drop from "9" and "3" positions for gentle machine action to eliminate shrinkage.

Control exact water level.

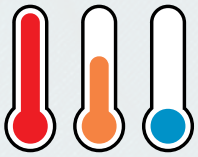
Low level for washing laundry concentrates detergents.

High level for rinsing laundry ensures dilution and neutral pH.

Lowest level for wetcleaning - perfect for delicate garments.

Control exact temperature.

150 degrees:
Higher temperature for better soil removal and proper bleaching.

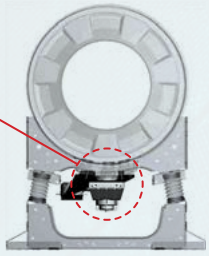


80 degrees:
Ideal for wetcleaning.

Control exact usage of chemicals.

Regulate the wetcleaning and laundry chemicals to the exact ounce for maximum protection and soil removal without wasting money on excessive chemical agents.

Wascomat wetcleaning washers feature larger sumps to thoroughly mix water and additives prior to coming in contact with the garments.



It's all in the details.

Precise control with Clarus & Compass Pro

- Fully programmable to the needs of wetcleaning (temperature, time, speed, etc.)
- WPM (Wash Program Manager) allows you to create new wash programs directly on your PC.

Frequency Motor Control (FMC)

By controlling step-by-step acceleration, drum speed and level of G-force, you'll see:

- Less mechanical stress on the fibers.
- Optimized drying time for delicate garments.
- Better cleaning results.

Dedicated range of external dispensers

The flexibility of our machines permits up to 13 different detergent dispensers to be connected. For each cleaning process your business offers – the correct amount of detergent is dispensed.

- Easy to use and eliminates operator error
- Guarantees reliability and optimum results.

Integrated cool-down function

Wascomat machines have an adjustable cool-down function to avoid creasing fabrics. This also improves the smooth finish of garments and the gentle handling of silk, wool and other fine fabrics.

Exceptional Residual Moisture Control (RMC)

Wascomat machines protect garments from over drying by measuring the moisture content of garments.

- Specially insulated lifters in contact with the garment
- The exact residual moisture is measured over 400 times per second
